

ABSTRACT

Abstract--CV Slamet Quail Farm is a quail livestock farming company. The main activity in companies other than quail farming is to make sales from the cultivation. Sales transactions are carried out in cash and credit with the recording of sales transactions still carried out manually using the administration book, and carrying out calculations carried out using Microsoft Excel by recapping the sales note. The process of recording and calculating is still done manually, causing delays in sales and accounts receivable reports. Therefore, an application is needed so that sales transactions can be computerized so that it can accelerate the recording, storing, processing and producing data in the form of reports. Making this application uses the software development cycle method (SDLC) and testing is done using black box testing. This application can provide convenience to the owner, the sales department and the finance department. The convenience is that this application can handle sales transactions, sales returns transactions, and can manage accounts receivable, payment of accounts receivable, analyze the age of accounts receivable, calculation of estimated uncollectible accounts and reminder to customers for payment due dates via Whatsapp. The results of these transactions will be published in journals, ledgers, accounts receivable books, trial balance sheets, sales reports, accounts receivable reports and accounts receivable aging analysis report.
