ABSTRACT

One of Kemdikbud (Ministry of Education and Culture) is to arrange National Exam (UN). The objective of UN is to evaluate students during their education according to their level of education. Although UN now is not being a condition for graduation anymore, it cannot be denied that UN is the only examination that has a national standard and implemented nationally. Because of that there was a lot of effort for schools to raise their students scores. However, with facilities inequality between schools in Indonesia make it possible to have a different quality of students between schools. With using Apriori Algorithm method writer like to show there are linkages between UN scores with school facilities and infrastructures. Based on two experiments there are relations between UN scores with school facilities partially.
