

ABSTRACT

UD.Permatasari is wholesaler and retailer multi-company. UD.Permatasari started at 1986 in Ciamis with its main business focus selling daily necessities and building materials. When it was first built, UD.Permatasari had one warehouse and less than 10 employees. Along with the development of its business today UD.Permatasari has 6 warehouses, 5 retail branches, and more than 60 employees.

As a multi-company company, UD.Permatasari has several financial problems. These problems include financial reporting and accounting books which are often not following field conditions that result in procurement and adjustment. This is due to many things including recording which is still manual, data duplication, inefficient business processes, and information that is not integrated between divisions. These things can cause huge losses for multi-company companies such as UD.Permatasari because of financial reporting errors. Although the current condition of the company is already using Microsoft Excel software to processing financial data, as a multi-company company the use of Microsoft Excel is not enough to integrate data that is increasing on a large scale every day.

Based on the results of the analysis it would be very appropriate if UD.Permatasari's financial and accounting uses ERP. ERP implementation at UD.Permatasari can use Odoo ERP which is easy to apply to multi-company companies and can be adapted to the needs of the company. Odoo ERP system design will identify business processes and user roles in the organizational structure to be adjusted. In this design, the Rapid Application Development method will be used because it sees that the customization is more appropriate for when testing is carried out immediately to find out more and more before it is applied.
