

## ABSTRACT

*Motorbikes are private vehicles that are one of the transport vehicles that are often used by Telkom University students. Therefore the campus needs to provide parking space. Existing parking lots are not sufficiently in accordance with the standards and land users are not safe from the weather when parking their vehicles because there is no roof in the parking lot. There is no roof facility in the parking lot because at any time the land is converted as the venue of the event. From this problem, I got the idea to design a membrane roof. The research method used is qualitative with a comparative approach and data collection techniques by means of observation, interviews, documentation and study of literature. The results of the discussion that the design of the membrane roof is designed with a system of dismantling so that the roof can be used as needed.*
