

## **ABSTRACT**

One cause of death that occurs throughout the world is caused by heart disease. Especially heart disease that is the most common heart disease, is Acute Coronary Syndrome (ACS) or better known as coronary heart disease. Many people do not know the symptoms of coronary heart disease itself. In fact, coronary heart disease is the heart disease that is most often affected by all people, especially in the productive age community that is 25-45 years. The occurrence of coronary heart disease is due to an unhealthy lifestyle.

Based on study that the author has done both through observation, interviews with several speakers and the target audience, use of questionnaires as well as literature studies related to the problem less known by the general public about coronary heart disease. That one of them is the lack of education about the symptoms of coronary heart disease itself, so people who do not know it become less alert or less concerned about the coronary heart disease.

The expected results of research in making a mobile application media, regarding coronary heart disease is that it can provide convenience in conveying information while attracting the attention of the public to learn things that need to be more concerned about coronary heart disease.
