

ABSTRACT

Academic information system is a system created to facilitate academic administrative activities in schools, where data is organized online. But in general the student report card grades at school still use manuals and there is no online marking. In the process of processing grades it would be better if there were facilities for students to check grades online so that the delivery of value information to students would be faster.

So in this final project a Website-Based Online Report Card Academic Information at Telkom Bandung Bandung can manage and display student report card grades, teacher, student, class, subject, student photo, and student ID photos. Database design design for Academic Information Online Report Card Based on the website consists of several elements, namely text, images, materials and research material and is processed using MySQL database form software, Web-based programming languages HTML and PHP.

Based on the results of testing the information system that is created functions to manage and display student report card grades, convey student information to find out its value without having to contact the teacher concerned. Can also be used as a medium of information directly to parents of.

Keywords: *website-based academic information, MySQL, PHP, Telkom Bandung Junior High School.*
