

ABSTRACT

Playing is an activity that is very much needed by children. Even playing activities are a necessity for children. Because the children's phase is the playing phase. From the play, children can also develop, starting from physical, emotional, cognitive and social development. Play activities also require a media, whether the media is an object or subject. For example the object is like a playground that is provided in public spaces. The park contains a vehicle that supports children's play activities. But in reality, many of the rides from the playground are less feasible to use. In fact, even today there is very little land as a playground. Many lands are used as residential areas or commercial buildings. Especially in densely populated urban areas. This design aims to find a solution for the Cipaganti sub-district, Coblong sub-district with the output of a children's toy product, which uses a small area or area as a children's playground. The method used in this study included direct observation in the field, interviews with related parties, searching literature studies and documenting data collection.
