

ABSTRACT

Children's growth and development is a determinant of development in their future. If a child gets affected by stunting, the impact will continue into the adulthood. In Babakan Ciparay itself, a lot of children have been stunted. The lack of mother's knowledge also can effect stunting on children. This problem can be solved by providing sufficient education to mothers about stunting and its prevention. Data collection method used is qualitative methods, so the right solution of the problem can be found. The results achieved in this design are websites aimed at mothers aged 25-35 years. Designing this website is expected to increase the knowledge of mothers about stunting and its prevention, so that it can help for reducing the level of children stunting prevalence.
