

ABSTRACT

Saparua Sports Center is a gathering place for many sports activities. GOR, which is located on the Ambon road, was once a place for music concerts. But now it has functioned as it should for sports activities. For Sports Venues, GOR Saparua is one of the places that has complete sports facilities such as running track, velodrome, basketball court, and even wall climb is available at GOR Saparua. With so many sports facilities owned, the activity of visitors is also very crowded because many people are exercising. Therefore GOR Saparua must have adequate supporting facilities for visitors who come. For the time being, several areas have been renovated, and the latest ones are the literacy corner and commercial areas. This commercial area is a place to accommodate the street vendors who were previously on the sidewalk and then moved to a neater place in the commercial area. But facilities such as commercial areas are less neatly arranged. Because usually the merchant's booth has a different size while the commercial area that has been provided has limited space. So it takes a booth for traders to have a booth in accordance with the area that has been given, which later is expected to provide order and comfort for the visitors who come. The design method used for this food booth is the SCAMPER method with qualitative data collection techniques. In its design that must be considered is the ergonomic form and also has an efficient function for all traders with their respective needs.
