

## ABSTRACT

---

*Employee recruitment is often held in a job event or commonly called job fair. But in the implementation there are obstacles experienced by several parties who participate in the job event including job seekers experiencing discomfort when attending the labor market events that take place because of the long queues and jostling so it is difficult to observe the company's stand one by one. As a result these job seekers often do not get a quota to apply. So we need an application that can register job vacancy from the online job event that gives a one-time opportunity to apply at each job event so that every job seeker gets the opportunity to apply. The focus of this research is the development of web-based job registration event applications. This web application was developed using the Prototype method. Built using the PHP programming language with CodeIgniter 3.1 framework and sublime editor tools. The result of this application development is a Web Based Application of E-recruitment Job Event Module.*
