

## ABSTRACT

---

The system makes security plans on the internet network and all types of files that can be indications of malware, but the more advances in security systems on the network and the internet are developing, so each virus is increasingly patenting functions and losses to each user who is affected by the virus. Cryptomining is a malware attack that can use the operating system and all of its resources on a PC to perform data mining to get Crypto currency / E-money files for Cryptomining users themselves and web sites affected by the injection malware get data mining losses.
