

## **ABSTRACT**

---

*Abu Aziz Elementary School is a school founded by the Abu Aziz Foundation, which has a deeper concept of Islamic religious learning. In this elementary school, recording financial reports is still manual using books and paper, so that there can be recording errors and other errors, such as books that are lost or exposed to water, torn, scattered, and so on. This web-based application was built to facilitate the work of elementary school employees so that recording could be easier and financial report data became systematically integrated. That way, recording will take less time because there is no need to search for books according to records. The activities that the author makes as a reference for building this application are recording income from registration transactions made by new students, re-registering, and recording other income transactions. Application development uses the programming language PHP, CSS, and HTML with a codeigniter framework. This application manages student registration, re-registration, and other income with financial reports in the form of ledgers, general journals, and cash-in reports. However, other income is not managed in detail per transaction.*

*Keywords: registration, re-registration, finance, system, administration.*
