ABSTRACT

PT Putra Kalibaru Indah is a company engaged in the distribution of vehicle spare-parts. One of the sales methods of the company is by consignment sale. PT Putra Kalibaru Indah acts as a consignor who is the party who entrusts its goods to another party. Problems that occur in the company is they ain't using a web-based application that can record transactions and execute accounting records in real-time. Therefore, a web-based application was built that could record consignment sales transactions, consignment sales payments, consignment goods returns that generate the accounting records in the form of journals and ledgers, and inventory cards using average methods and income statements. This web-based application aims to facilitate the company's business processes in managing the consignment sales. This web-based application built by using the PHP programming language and MySQL database. The method used in working on this final project is the Software Development Life Cycle (SDLC) method using the prototype method as a development model in building this application.
