The construction of buildings in the city of Jakarta is currently growing faster than compared to the construction of green space. The presence of green space in the middle of the city is very needed, but due to land limitation in the city, green space can be made in another way, that is constructing green buildings. Green building construction has big benefits for the environment, and also for the building users. Environmentally friendly implementation in the building itself can be carried out in various functions, not least in the work space like co-working space. Co-working space is a rent space that function as work place, and also for interacting and collaborating both individuals and groups, suitable for flexible workers of millennial generations such as freelancers and startups. The growth of startups in the city of Jakarta day by day increasing, and this will cause problems like the need for facility. The need for green space and co-working space facilities in the city of Jakarta is the background of the design project. Co-working space that pay attention to health and comfort in spaces that have benefits for user space, such as increasing productivity. This interior design project is expected to provide public facilities for flexible workers such as freelancers and startups, named Creative Rent Space Jakarta using Green Design approach.

Keyword: *Co-working space, startup, green building.*
