ABSTRACT

Non-formal UKM occur in many communities, where there are many small businesses or pioneering from the community in an area. Usually the community is formed because of a common profile of the members of the community. One of the pioneering businesses is the cake business, the Arumi Cake. The cake business is run by a community that has members with several different fields of expertise. Because the business was formed directly, many things still use manual management, such as recording sales transactions, recording production process transactions, making transaction journals, income statements, and others. with the recording which has still not been systemized the impact caused is ineffective and inefficient process of making transaction records, and in preparing financial statements. In solving the problem, the proposed information system process design will be carried out and will be applied to a software so that the work process of making reports is more effective and efficient. The proposed business processes that have been obtained will be mapped in the application design. The features contained in the application are tailored to the proposed business process activities. The system to be built is a web-based application that uses the programming language PHP, HTML, CSS, and MySql for the database. And also use the waterfall method. With this application it is expected that the process of recording transactions and making reports can be done to the maximum.
