The needs of Klari's sub-district community about health service recently increased (quoted from interview result with one of hospital staff in Klari district). The good hospital, of course prioritizing quality from that hospital services to consumer or patient. Other than that, physical shape and interior also play a role to determine the good or the bad consumer assessment of that hospital. At least the good or the bad consumer assessment of that hospital. At least the good physical and interior will give good judgement to that hospital so that will give comfort to the user so that will speed up the recovery process. Because the hospital that will be designed is a growing hospital, so that the room effectivity inside becomes less maximal especially in public areas like in outpatient installation area (Poluclinic) and other waiting area with sitting facility that less comfortable for a long wait, lack of natural light utilization and artificial lightning that gave the creepy impression to visitors psychic or patient, no supporting facilities for children, other than that poorly processed interior element so it seems boring and less comfortable to the user. To solve that problem, required a right re-décor system base on a medical standard that very important for the general hospital building. It fits the modern concept that used in the interior design of this C class general hospital so it fits the vision and mission that want to accomplished becomes a family health service center with prioritized professionalism.
