

Abstract

Sexual Harassment is a serious problem that often occur in our environment. One of the cases of sexual harassment that can be found in our environment is sexual harassment in academic circles. In this study, the authors classify sexual harassment experiences that are shared by victims through the web survey addressed to theprofesorissin.com using the K-Nearest Neighbor method. The system was built through the preprocessing stage, term weighting, splitting training data and test data using k-fold, classification using K-NN, and evaluation. In this study, the accuracy of the system reaches 64,65% with a K-neighbor = 42 and in k-fold = 10.

Keywords: *sexual harassment, academic circle, K-NN, classification*
