

## ABSTRACT

---

*Murrigany Konveksi is a manufacturing company that produces various kinds of clothes to order from customers. The Murrigany Convection business process in recording order and settlement transactions is carried out conventionally, while the determination of the selling price uses the estimation method which can cause differences when providing the selling price. This final project will produce an accounting application that aims to help determine selling prices, manage order records, record repayments, journals, ledgers, and cost of goods manufactured reports. To support calculation and recording activities, a web-based accounting application was built using the PHP programming language, CodeIgniter framework, MySQL database. This app is used by sales and owners of the Convection Murrigany. This application can store data ranging from Bill of Material data, order data, payment data, journals, general ledgers and cost of goods manufactured reports.*

*Keywords: Application, Framework CodeIgniter, MySQL, Cost of Goods Manufactured.*
