

ABSTRACT

Practical work is a compulsory subject for students who are pursuing a Strata 1 (S1) study period. To do practical work, students can enter letters written on websites for practical work. Up until now on LAA FRI, administrasi.cloudfri.id was used for filing papers only. Previously all processes in practice work were done by hand such as using hard copy files in paper form collected to the lecturer. So it has created a practice work website with the addition of academic guidance features, field advisers, occupational data, collecting documents, template reports, an activity log that aims for facilitating students to perform good and needed practice work. The making of websites for practice work is done using a PHP (Hypertext Preprocessor), with the Laravel framework. Websites can be used by all students at the faculty of industrial engineering studies, from filing applications to receiving points. So that the practice work website on the industrial engineering faculty can be created according to the user's needs.
