

## **ABSTRACT**

The final project report with the title "**Pengembangan Desain Bar Stool Dengan Pendekatan Aspek Fungsi**". Departing from the user's problem in the limited space for movement when using a stool type chair that has difficulty storing or putting items that are being carried or worn at that time. To produce a problem, how to design a stool type chair product that is expected to meet the needs of its users and the selection of materials that are suitable for comfort by considering the visual aspects of the product design. So that a design solution is obtained with the aim of stool design innovation to meet user needs with additional features of storage compartments and hook without compromising product aesthetics and comfort.

This design focuses on designing a stool type chair and describes and examines the needs of its users on the function of a stool type chair product. The method used in this final project is a discussion of analysis starting from the background of the problem that focuses on user needs, user convenience, and product functions. This design uses descriptive qualitative methods.
