

ABSTRACT

Currently, people have often consumed coffee so this has become a habit. The number of people who consume coffee causes a lot of coffee grounds too. The problem that occurs in this study is the amount of coffee grounds that is wasted because it is no longer used so that this coffee grounds will accumulate and not be utilized optimally and will be wasted in vain. This study aims to find solutions to treat coffee grounds waste to produce materials that can be used or designed into a product. The method used in this research is to use a method with a quantitative approach and an experimental method so as to get a suitable percentage of material to be used as a product. The coffee grounds material will be combined with various kinds of mixed materials so that it gets a strong material and still looks attractive for a product material. Based on the results of the survey by giving questionnaires to several respondents in several coffee shops, it can be concluded that the product that is suitable to be made using coffee grounds is a watch product. So the researchers chose a watch product as the final product in this study.
