

ABSTRACT

These days, many jobs that used to be done offline are turning online. This is also due to the Covid-19 pandemic. People are not far from various work support devices such as PCs and smartphones. The level of repetitive work also increases, such as data input, sending emails and various other things that are done repeatedly. Not many people also know that these various jobs can be automated or operate automatically. Whereas if repetitive things or light work are handled by bots, users can do other things of higher value. Micro, Small and Medium Enterprises (MSMEs), especially in the Food and Beverage (F&B) sector, generally require tools or applications that can assist businesspeople in managing inventory data, especially raw material stocks. Automate All innovates to build a website-based bot software that can handle various things that become less human intervention because various calculations are carried out by the system. Software can perform product management, inventory management of goods or materials, record customer orders, calculate cost of goods sold and make financial recaps. The purpose of this software is so that businesspeople can get maximum results in an efficient way.

Kata Kunci: *Repetitive, MSMEs, Software, Website*
