Abstract. Online Transportation System in Indonesia is growing rapidly. The development of OTS usage is also growing,there is even research that discusses about most OTS users are people who are Undergraduate education and single. Mobility student users are also high with the need for those who travel to spend time with friends, duty, and other needs. Behind it all there is a problem in OTS in protecting passenger data, the case is the sale of hacked OTS accounts. This study looks at whether there is a correlation between users with privacy data perspectives and risk factors. In this study, SPSS was used to look at bivariate correlation values. This study used 110 respondents who will be analyzed and viewed the correlation value. There are 4 significant correlations between the background of respondents with privacy data perspectives and risk factors.
