ABSTRACT

The Indonesian National Army or TNI is an armed force owned by Indonesia. In carrying out his duties a soldier will never be separated from the existing alutsista. Alutsista stands for Main Tool Weapons System, because it is a symbol of defense, then alutsista functioned as a state force. Therefore the performance of the existing alutsista must be maintained. Alutsista is very much in number so sometimes to perform the treatment becomes very difficult, manual checking periodically will be very time consuming and troublesome because the officer can not mark which treatments have not received treatment. In the final project entitled "Harwat : Defense Equipment Management App in TNI Environment Based on Android" made an android-based application that is expected to facilitate officers in conducting data collection so that checking the performance of alutsista can be more effective and efficient. In this application the officer can see the list or list of alutsista that exist, the officer can also see the list of alutsista who need treatment and directly apply for treatment more effectively and efficiently.
