

ABSTRACT

Health is very important for human life because without good health conditions, a person will have difficulty in moving. According to the World Health Organization (WHO), health is a state of prosperity that includes physical, mental and social that is not only free from disease or disability. So, it takes effort to maintain a person's health both medically and non-medically. One of the efforts to maintain health is to visit the hospital. However, in this era there are still many hospitals that tend to only pay attention to its institutional nature without paying attention in terms of visual comfort of users, one of which is Asri Purwakarta General Hospital. In addition, the problems in this hospital are spatial problems, less communicative direction signs, and the use of inappropriate materials. The design method of this redesign consists of several stages with data gathering by observing directly at the location. The purpose of this design is to redesign the interior of a public hospital that pays attention to patient comfort using a healing environment approach by examining aspects of nature, senses, and psychology. This redesign is expected to improve the service and comfort of patients of Asri Purwakarta General Hospital.
