

ABSTRACT

Cirebon Regency Regional Library is a district library which is located at Jl. Sunan Drajat No.9, Sumber, Plered-Cirebon. This library is located in the Cirebon Regency Government Service area. As for the results of observations on the Regional Library of Cirebon Regency, it was found that problems such as the processing of the collection room and the utilization of the collection were not optimal, causing the room conditions to become less functional, uncomfortable library facilities and unorganized book collections, the atmosphere of the library space was not representative and monotonous, as well as the unavailability of room facilities for service activities in the library. Therefore, the purpose of this design is to design a Regional Library that has comfortable facilities both in terms of visuals and ergonomics, as well as complete facilities with an attractive and representative library atmosphere to be able to attract public interest in coming to the library. The approach that will be used in this design is the SMART Library. This approach is used to answer the problems found in the Regional Library of Cirebon Regency which are closely related to library facilities that are still limited and the library atmosphere is not representative which causes a decrease in visitor interest in coming to the library. This approach can also answer the expectations of the Regional Library of Cirebon Regency in making the Library not only functioned as a means of reading and seeking information, but also as a means of educational recreation with a variety of facilities that are fun to visit at any time in order to increase knowledge and knowledge of the community.
