

ABSTRACT

Because there are Qur'an memorization groups on social media that have good concepts but are less efficient in the process, there are complaints from members who complain about several shortcomings such as, after completing the memorization of a letter the group is changed or deleted, video data and materials for memorizing consume device memory, and are difficult to search for memorization files when needed again. In addition, if there is important information sometimes other users' chats are overwritten. Based on the literature study, namely a series of library data collection activities, reading and taking notes as well as interviews with the congregation who memorized the Qur'an and the founders of HOTS and observations. With this complaint, an application was designed to help the memorizers and their mentors, for the memorizers to create a special space in finding memorization files, storing data in cloud storage, interacting with other users without disturbing other activities, and memorizing letters deposit media and for supervisors making space for correcting letter deposits, providing information, and providing rote material. In addition, new innovations in memorizing are also designed, namely with videos containing the sound of reading the Koran, movements, verses of the Koran, and their translations, a new feature in memorizing the Koran, namely recording, can only use voice or video and collaborate with other users and even famous figures.
