

ABSTRACT

In this digital era, the need for easy, fast and timely information is also an important requirement to support human activities. Information technology-based businesses can complement or even replace manual business methods. In managing the incoming cash at the Matahari Cigado Regency, manual recording is still used and the payment method is still conventional. Based on the aforementioned problems, a web-based application was built for the management of incoming cash with the help of a trusted third party to act as an intermediary in making payment transactions. This system is called a payment gateway. This application is built with object orientation with the development of the Software Development Life Cycle (SDLC) model and uses the PHP programming language and CI framework. This application can immediately handle the process of recording cash incoming transactions that occur until the making of monthly reports at the end of the current period to obtain more accurate information.

Keywords: Cash In, payment gateway, third party, Web-based application, CI Framework.
