

ABSTRACT

Production house is a company or organization that produces a work of audio and/or visual audio. As a company whose operations are producing, companies are obliged to calculate the total cost of production. The company makes up the planning and realization of the cost of production, but still in the traditional way and accounting records in this company remain incomplete. Based on the problem, a web-based application is built that can do the planning and realisation of the cost spending of film production. The application was built with a bjek - oriented method and a SDLC model development. It also uses PHP programming language and the framework codeigniter. The application's functionality has been for the creation of a budgetary planning using the activity-based budgeting, making realisation of movie production costs, creating accounting notes in public journals and ledgers, presenting movie production a budgeting planning reports, and presenting a film creation realisation report and a film production comparison report. Functionality results after a black box testing.

Keywords: budgets, planning and realization, framework codeigniter, activity-based budgeting.
