

ABSTRACT

The public is no stranger to using one of the KRL Commuter Line public transportations to travel between regions in a short time on daily activities. Every day, the people who come are also different and have their own backgrounds, in terms of health, each individual also has a different lifestyle that can live healthy or unhealthy. Due to the density of KRL used by the community, not a few passengers have epilepsy symptoms, so an ambient media-based infographic was designed which is applied to several train points that contains insights regarding the handling of epileptic seizures while passengers are waiting for the train to arrive or while on the train so that the public has awareness. and can play a role in helping to help people with epileptic seizures that can occur anywhere. In the data collection process, interviews will be conducted with health workers and people who have had contact with epileptic seizure sufferers. Then the data will be accumulated and analyzed so that a discussion topic will be discussed in the form of handling epilepsy seizures, how to find out further treatment, and the initial causes of epilepsy. The subject of the discussion will be explored so that it is useful for the community in providing awareness with basic knowledge on how to deal with epileptic seizures in densely populated areas, one of which is KRL.
