

ABSTRACT

Waste is a waste product that results from human activities, basically waste is divided into two parts, namely household waste and industrial waste. Household waste is usually generated from household activities, while industrial waste is waste produced by the residual disposal of an industrial production activity. Waste is further divided into liquid waste and solid waste. The problem with waste is still difficult to solve until now, one way to minimize waste is to recycle waste that can be used. Humans are creatures created by God who have activities in filling their lives, therefore time is so important to humans, watches are a human-created timepiece that can make it easier for humans to carry out their daily activities. In general, watches are divided into two, namely, analog watches and digital watches. An analog watch is a watch that has three main hands as a timepiece, while an analog watch uses a Liquid Crystal Display (LCD) screen. In this design, the method used is qualitative to chlorinate and to see what is needed in designing this analog watch. On this occasion the writer wrote this proposal by looking at the existing problems to make the basic material in designing an analog watch.
