

## **ABSTRACT**

*The final project design report written by the author will discuss multifunctional furniture for workspaces at home with scandinavian minimalist themes. Furniture designed will use white and combined with natural wood colors. This design is based on the data that the authors get by using qualitative methods as research methods. The qualitative method is the process of investigating understanding based on different research methodological traditions that explore social or human problems. Researchers create complex and holistic images, analyze words, report detailed displays of information, and conduct research in a natural setting. Based on the data obtained, most of the workspace users complain about problems there, such as a lot of supporting workspaces, items that cannot be organized properly, so it will create a narrow and untidy impression on the workspace. With complaints like that, users must tidy up first before carrying out their activities, and it will be a waste of time for users when they are active in the workspace. So the author will plan and create solutions for workspace users so that they can work optimally (effectively and efficiently), increase productivity, and give a broad impression on the workspace, namely by making multifunctional furniture for the workspace.*
