

ABSTRACT

Along with the development of the music industry players began to use various media as a means of selling their work, and one of them is internet media. With the rapid development and speed of the internet, making people's activities more and more easier, this is what makes people today prefer to listen to music online rather than choosing to download it. Based on these problems, a music streaming application that is connected to a web server will display songs that are available on the web server database and allow users to create playlists on this application. This application is built with the prototype development method, the PHP programming language with Laravel framework, with the MySQL database. Testing this application using the black-box testing method and the test results have proven that this application has reached the goal of the existing problems.

Keywords: Web server, database PHP, Laravel, MySQL
