

ABSTRACT

Fachrozi, Wahyu. 2021. **Symptoms of Hallucinations in Altitude Illness Against Mountain Fog**. Thesis. Fine Arts Study Program. Faculty of Creative Industries. Telkom University.

At this time mountain climbing activities are used as a lifestyle among young people, but many do not know the various diseases that occur at high altitudes, one of which is Altitude Sickness or commonly called altitude sickness. For someone who is not used to heights, his body needs time to adapt to these conditions, in this altitude sickness there is one symptom, namely symptoms of hallucinations. The higher a person's position on the mountain, the more susceptible they are to hallucinatory symptoms, such as catching mysterious voices that come from nowhere. And the chance of someone experiencing these hallucinatory symptoms is greater if mountain fog comes, mountain fog is usually thicker than fog on low land, thus limiting one's visibility and disturbing the climbers' breathing. In this final project the author tries to describe the situation of how the author experiences when climbing a mountain and trying to adapt to the extreme conditions that exist on the mountain, especially in responding to hallucinatory symptoms due to altitude sickness using the medium of video art.

Keywords: Symptoms, Hallucinations, Altitude Sickness, Mountain Fog, Video Art.
