

ABSTRACT

The village Biyawak is a village that requires a system of information Administration population that can be done pengolahan data related to the process of information about the Village Biyawak, registration data population, data family, the population data, the domisili and print the introduction of the country. The processing of data as it is still running recorded in the data demographic. In the service and information to the public is still conducted manually, all the data recorded in the book. In the search for the data population administration was to find the first in buku- books the parent. While knowing the public information should take the time came to the office. A barrier faced by the process is a time-consuming and the risk of mistakes in the registration data like no KK doubles. This can be overcome with build a system of information that more effective. The administration Penduduk Information Systems Rural Situs Berbasis Village Biyawak built using a case study descriptive Village Biyawak. For a systems development using the waterfall, while to build describe the flow of the data using BPMN. Software used to build the system is PHP (Hypertext Preprocessor) and XAMPP as the connection to the database MySQL.
