

ABSTRACT

Currently, technology is developing very rapidly. We must follow the flow of technological developments by using it for good and useful things, so as not to be said to be left behind. Everything can be accessed easily through technology, including in the field of education. Starting from attendance, report cards, to learning can be applied with technology. Because of these technological advances, students open smartphones more often than books. According to Ms. Ana Amalia S.Pd., as a Sundanese language teacher at the PBB Arjasari Vocational High School, students often assume that the Sundanese language is only used by parents, while for their age, it is considered inappropriate to use, therefore innovations are needed that can reach a student's lifestyle that is today's all-technology in the form of applications to facilitate the learning process. Based on this, the author created an android-based Sundanese language learning application for students of PBB Arjasari Vocational High School, which aims to learn Sundanese. The application, which is named “Belajar Sunda”, has almost the same function as a book, but can be accessed via a smartphone. Learn Sundanese, contains learning materials and questions in accordance with the curriculum taught for 10th grade students of PBB Arjasari Vocational High School. After making the application, the author made a survey via google form with 11 respondents who gave a positive response to the innovation of Sundanese language learning applications.
