ABSTRACT

The car is means of transportation used to take people to various travel destinations. Many people want to be able to drive their own car. This is used by business people to open a driving course business, one of which is the Waras Driving Course Institute. However, the Waras Driving Course Institute still has shortcomings, namely in the registration procedures, recording transactions, scheduling, and making monthly reports which still use the manual system so that errors often occur in the system. Therefore we need an information technology-based system to fix the old system weaknesses.

In making this new information system, it is intended that students can register their own course schedules via the website. In addition, this new information system can record transactions, scheduling, and displays a report on the operations of a Waras Driving Course.

Based on the explanation above, a website-based waras driving course information system was developed that can provide structured data processing and make it easy for students, and admins/owner of the car course.
