

ABSTRACT

The rapid development of technology makes it easy for humans to manage a system. However, with the rapid development of technology, especially of work are not able to take advantages of this technology. One of them is the problem with Micro, Small & Medium Enterprises (MSME) which have several main problems such as lack of financial control. Kedai Intikopi is one of the MSMEs that has not implemented the benefits of this technology.

The process of financial recording that still uses the manual method has several risks, including the calculation process that takes a long time, and a big risk occurs when the record is lost. Therefore, we need a system to record all financial statements to overcome these problems. The method used is agile development scrum because this method involves the user in every stage.

Based on application testing using black box testing and ISO 9126, it was found that this application helps users in managing finances at Kedai Intikopi because all data has been integrated so that financial reports will automatically be printed immediately.
