

ABSTRACT

Along with the increasing development of the digital information technology from time to time, and increasing population in line with the increase in the number of vehicles, transportation is a major component in today's life needs, but with high car prices and for certain reasons some people prioritize using car rental. Limited information about the type of vehicle, price, and location is a problem for vehicle service tenants. Cases of vehicle fraud make tenants reluctant to trust the provision of car rental services that do not have clarity on the security and legality of the business.

Based on the existing problems, we draw a conclusion in the opportunity to develop a service provider by making an application as a liaison between vendors (car rental service owners) and vehicle service tenants (consumers). The existence of this application can help the lease process faster and clearer without limited information with transactions that can be done either transfer or cash. This is expected to help and improve the delivery of information, and make it easier for customers to order online without worrying about the losses that occur on their part. And a solution for car rental service users to be more efficient and easy to do car searches
