

ABSTRACT

Artificial Intelligence (AI) is an artificial intelligence that's made in the form of machine to help human stuff. Now digital cameras and even smartphone cameras are equipped with AI features. This features really helps people in capturing moments quickly and easily without bothering with manual settings with photos that automatically adjust the contrast and color balance and the incoming light.

Because of the large number of consumer interest in digital cameras with technology that has greatly pampered consumers, the production of analog cameras has reduced and now at this time hard to find. In my opinion, for taking professional photos, you still have to use the manual settings, but it is assisted by AI technology both in focusing and detecting object only, then the color, liht, and other settings are done manually to get the result you want. And the final result is still maximized with existing technology in software such as toos in photoshop which are often used by professional photographers to maximize their shots.

And for analog cameras, i thing there are still a lot of people out there who still use them even though analog cameras are quite rare for now. Because there are also many people who have a hobby of taking pictures using analog kameran even though they know the process is very long and very time consuming.
