From many textile techniques that have developed in the fashion sphere, one of the techniques which is the modular interlocking technique. Modular interlocking is a locking technique that combines components or modules so that they can be easily exchanged or replaced resulting in a larger structure and a solid piece. The advantage in this modular interlocking technique is that it can produce textures, shape compositions and color compositions so as to produce beautiful visuals. This uniqueness makes modular interlocking technique having a high value and has the potential to be used as an embellishment. In this research, researchers will develop a modular interlocking technique by taking inspiration from the form of the Pom-pom Dahlia flower and developing it into embellishment. The exploration process includes material aspects, shape composition and color composition to produce attractive visuals so that it is suitable to be applied as an embellishment in work clothes.
