

## **ABSTRACT**

*In the Faculty of Electrical Engineering, there is an Academic Administration Service (LAA) whose one of its duties is to provide student services in the implementation of the final project, starting from the search for the title of the Final Project to the registration of the Final Assignment Session. Currently, the process that occurs has not been systems properly, and the process is still manual in document archiving and document input and may result in lost documents in the process of searching for the title of the Final Project until the registration of the final trial session. This study aims to simplify the process of finding the title of the Final Project to the registration of the Final Assignment Session, where the current registration system still uses a manual input system.*

*In this study it can be concluded that the web application system for selecting the title of the Final Project to the Implementation of the Final Assignment Session can reduce all activities that have taken a lot of time, such as, students must ask the supervisor directly about the title of the Final Project, the distribution of files must go through the process manually, to reduce paper waste due to files used during the process.***Keywords: Web Application, front-end, back-end, PHP, HTML, CSS, Laravel framework, Final Project Session.**
