

## **ABSTRACT**

*The Covid-19 pandemic has had an impact not only on the health sector but also on the economic sector. This is confirmed by data on the economic growth rate of West Java which is below the national value. The government is trying to strike a balance between economic stability and overcoming Covid-19 cases so that resources are increasingly limited. Sustainable development must prioritize sectors that have strong links with upstream and downstream sectors, so that it has implications for future economic growth. The purpose of this study is to determine the linkages of the economic sector of West Java Province and to design a roadmap of priority sectors of development in the economy of West Java Province using input output analysis. The results of this study indicate that the manufacturing sector, electricity and gas procurement, and wholesale and retail trade; Car and motorcycle repairs have a high direct and indirect linkage value. Then, the electricity and gas procurement, manufacturing, and construction sectors have a high value of direct and indirect forward linkages. There are three industries that are categorized as leading sectors in West Java, namely the processing industry, electricity and gas procurement, transportation and warehousing. The benefits of this final project are as material for consideration for policy makers in formulating development strategies for West Java Province and input for investor considerations through investment activities.*
