

ABSTRACT

Tuberculosis is an infectious disease caused by a bacterium called Mycobacterium tuberculosis. The majority of this disease attacks the lungs, but can also affect other organs. Indonesia ranks third for the most tuberculosis cases in the world per year. The government and the Ministry of Health have supported the WHO movement called "2030 free of tuberculosis" by making the DOTS program, where DOTS is a Tuberculosis treatment program followed by almost all health facilities throughout Indonesia. However, with the increasing number of cases of the Indonesian population contracting tuberculosis due to a lack of understanding about tuberculosis. This is the background of the author to provide an explanation to the public so that they can participate in anticipating and preventing the development of Tuberculosis disease in the community. The research method used is a qualitative method. The author collects data through interviews with the doctor concerned. The theoretical basis used in the design of this infographic is the theory of information media, the theory of infographics and the theory of visual communication design. The main media used by the author is interactive infographics.
