

ABSTRACT

Regional development is an important part of national development which must be implemented in a synergistic, efficient, effective and sustainable manner. In carrying out its regional autonomy, the district government needs public interest facilities and infrastructure as a forum for local government activities/activities in carrying out service tasks to the community and serving the public interest in the district. The regent's office is a place provided by the government that is used by civil servants for work, which is equipped with several supporting facilities in it. The Regent's Office is one of the agencies engaged in the field of public services. Solok Regency is an autonomous region that has been around for a long time and has its own government structure. The focus of this design is the Solok Regent's Office Building in Solok Regency, West Sumatra. As a government building or a state building, this building has problems in the areas of comfort, circulation and building aesthetics. The problems encountered in the building are the application of layout, facilities, circulation, and the lack of office identity as a regional government office. Therefore, the Solok Regent's Office will be designed by applying elements of regional culture to the building and applying an Eco-Friendly design that can create a comfortable room and depict the image of the area.
