

ABSTRACT

The COVID-19 pandemic has plagued almost all over the world, this pandemic affects many aspects of life, both in work, health, and social aspects in society. During the pandemic period, people are encouraged to carry out restrictions on social activities by keeping a distance during activities in public spaces until there is a decrease in cases in Indonesia. As of October 24, 2021, there was a decrease in cases of COVID-19 transmission, there were only 623 cases in Indonesia. With the decline in the transmission rate, it will have an impact on easing public activities outdoors such as in public spaces, the community will enter the New Normal phase where there are adjustments and adaptations to new habits after the COVID-19 pandemic, people are allowed to do activities in public spaces such as carrying out activities in public spaces. coffee shops while maintaining the health protocols set by the government. Activities in public spaces during the New Normal must be supported by sitting facilities that can support the adaptation of the community to outdoor activities. So it is necessary to design a sitting facility in a public room to support community activities in the New Normal period. The design of this sitting facility uses a qualitative method by conducting direct observation and interviews to obtain valid data, by adapting the community's new habit of keeping a distance, which will be applied to the designed seating facility.. This product will be placed at Work Coffee Indonesia in Bandung and placed in an outdoor area, Work Coffee was chosen because it has a large outdoor area and is always crowded with visitors. This design is expected to meet the adaptation needs of the community when they are at coffee shops and public spaces in the New Normal period.
