

ABSTRACT

There are so many street vendors whose sales process is done manually which makes it less effective and efficient for customers and street vendors which allows for losses between the two parties. One solution is to create an order queue system on a web-based sales application for street vendors. This system will make it more effective and more efficient than the manual system because customers just sit back and order menus from the website. And for merchant, it will not waste too much energy because all order details are already stored on the website.
