

ABSTRACT

Information systems are a crucial factor for companies that provide services to the community. One of them is PT Cilegon Fabricators, a fabrication company that is established in the Cilegon area, Banten. Every week this company receives more than 30 guests and it is not uncommon for paper as a source of visitor information to become damaged or wrinkled. Therefore, it is necessary to replace paper as a source of visitor information, namely by building a reception website based on Artificial Intelligence which is expected to help visitors/guests and help companies to process guest data and activities. In developing this system, using figma and sublime 3 applications to create wireframes and coding. As a result, the reception website is suitable for use in the company and if in the future there are bugs or errors, maintenance will be carried out to fix them.

Keywords: Information System, Fabrication Company, Artificial Intellegence.
