

ABSTRACT

In the midst of society, university students have an important role and are expected to take advantage of their knowledge, expertise, and intellectual experience. One of the skills that university students should have been the ability to manage finances independently. In the current era of rapid technological development and the rapid dissemination of information, university students' needs become more complex. Moreover, low financial literacy, changing needs due to the transition from adolescence to adulthood, as well as environmental influences make university students adopt a consumptive lifestyle. This study aims to design a mobile application that is expected to support and add insight into financial literacy effectively for university students. Data would be collected by interviewing relevant sources in the financial sector and also university students. The data obtained were analyzed as a basic understanding of designing the user interface which was considered to be a good solution for existing problems.
