

ABSTRACT

Financial Management is the activity of planning, managing, storing, and controlling funds and assets by a person. The purpose of financial management is to practice a frugal lifestyle, the meaning of frugality is to live well, where a need is met, to practice regular life, to have better future planning, to be able to cope with unexpected needs, to be able to avoid debt, and to give charity. In addition, the draft budget (RAB) is also required before recording personal finances. Therefore, we really need to manage finances. With this application that will be made, we can record every financial management that is carried out every day. The methodology used in this research is the System development Life Cycle (SDLC) method of the Water-fall model and the software development method using a prototype. Meanwhile, in making the software using bootstrap, a CSS framework library that has been specially created to develop the front end of a website that is prepared using the PHP language with the CodeIgniter framework and a database using MySQL.
